

## **Known Issues - Lab Order Interface 3/16/2015**

Issue	Status
<p>The NIST validation of coded elements is too restrictive under certain circumstances.</p> <p>The NIST core validation will only accept the following options for a coded element :</p> <ul style="list-style-type: none"><li>- One triplet is valued with a code/code system from the value set defined in the conformance profile. The other triplet is empty (if the usage allows is).</li><li>- One triplet is valued with a code/code system from the value set defined in the conformance profile. The other triplet is valued with a code from a local code system. The allowed values for local code systems are "L" or "99zzz" where zzz represent EXACTLY 3 alphanumeric characters.</li></ul> <p>Both triplets are values with a code/code system from the value set defined in the conformance profile.</p>	<p>If the message meets the value set requirement from the guide, any error related to the second code/code system can be ignored. This issue will be fixed in the future.</p>
<p>The LOI_HL70200 value set contains the value 'M' which is only required for the PH profile. Therefore the NIST LOI tool will not issue any error if the value "M" is used in XCN_NG.10, XCN_GU.10, XPN.7 or XPN_1.7, even in messages that don't claim conformance to the Public Health profile component.</p>	<p>This issue will be fixed in the future.</p>
<p>If the IE browser is being used to access the LOI test tool, some of the columns displayed on the Message Content tab may be skewed.</p>
